

MOTORCRAFT® AUTOMATIC TRANSMISSION FILTERS

Help Maintain Optimum Transmission Performance

Replacement transmission filters remove contaminants from the fluid, to help the transmission operate as designed. Motorcraft® Automatic Transmission Filters are designed, engineered and tested to help ensure peak transmission performance throughout the life of the filter.

Transmission Fluid Filter Features

- Each filter meets the specific needs of its application and intended service life
- Filtration efficiency is fine tuned to match each transmission's fluid cleanliness requirements to help ensure transmission durability throughout the intended life cycle
- Filters are engineered to maintain fluid flow rates even as wear debris accumulates
- Filter housings are constructed from advanced fiber reinforced temperature-resistant polymers or a combination of polymers and stamped steel
- In most cases, new pan gaskets are not needed when performing transmission filter service

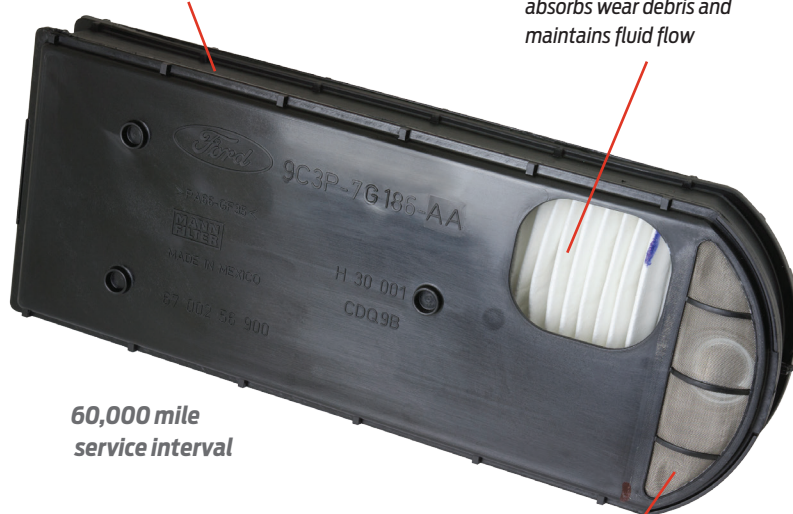

Tested Tough

- All Motorcraft® Automatic Transmission Filters are performance tested to meet Ford standards for each application
- Filter media strength is tested to withstand the most extreme "dirt" loads under extreme wear conditions at elevated temperatures
- Filtration and hydraulic performance testing is performed according to procedures approved by the International Organization for Standardization (ISO)

FT-180

Filter housing –
constructed of glass fiber reinforced
temperature-resistant polymers

High efficiency media –
absorbs wear debris and
maintains fluid flow

**60,000 mile
service interval**

Filter bypass screen –
even when bypassed, screen helps
filter larger debris

Motorcraft

Right Part. Priced Right.

FT-187

Dual-Media Filter – provides fine filtration for long-term wear reduction and coarse filtration for cold temperature (down to -40C) drive-away performance

Filter Housing – constructed of glass fiber reinforced, temperature-resistant polymer and high-strength stamped steel

150,000 mile service interval

Filter O-Ring Seals – constructed of Vamac® elastomer for consistent sealing in all temperatures

Dual-Media Filter – provides fine filtration for long-term wear reduction and coarse filtration for cold temperature (down to -40C) drive-away performance

FT-199

Two Magnets – help collect metallic debris before it gets to the filter media

150,000 mile service interval

Laser Welded Housing – helps ensure structural strength and minimizes flash debris
